## Ordinary Multiple Regression

Regression variables $=$ DepVar IndVar1 IndVar2 IndVar3 ...
/statistics coeff $r$ tol
/descriptive = n
/dependent = DepVar
/method = enter.

## Hierarchical Multiple Regression

```
Regression variables = DepVar IndVar1 IndVar2 IndVar3 ...
    /statistics coeff r tol
    /descriptive = n
    /dependent = DepVar
    /method = enter IndVar1
    /method = enter IndVar1 IndVar2
    /method = enter IndVar1 IndVar2 IndVar3.
```

# Elaboration Paradigm <br> (things that can happen in control tables) 

## Common Terms

1.replication

2a explanation
2b interpretation
3. specification
4. suppression
5. distortion

## Elaboration Paradigm

(things that can happen in control tables)

| Elaboration Terms |  | Psych Terms | Common Terms |
| :--- | :--- | :--- | :--- |
| 1. replication   <br> 2a explanation  spurious | confounding <br> 2b interpretation | mediation | intervening |
| 3 specification | moderation | interaction |  |
| 4 suppression |  |  |  |
| 5 distortion |  |  |  |

## Elaboration Paradigm <br> (things that can happen in regression)

## Elaboration Terms

1. replication

2a explanation
2b interpretation
3 specification
4 suppression
5 distortion

## What we see

same results as original IV-DV relationship
control reduces or eliminates original IV-DV relationship
control reduces or eliminates original IV-DV relationship
an interaction term predicts the DV
control increases or reveals an IV-DV relationship
entering control results in complex pattern

## Summary Notes on Statistical Elaboration

## J. Fletcher

| Name of Effect | $\begin{array}{lr} \text { Crosstab } & \text { Symb } \\ \text { Results } \end{array}$ | epresentation | ion <br> Results |
| :---: | :---: | :---: | :---: |
| Replication | Same results in control tables as in original table without controls | Irrespective of $Z$ $x \leftarrow \rightarrow Y$ | X predicts Y with and without Z being in equation |
| Explanation | All control tables show weaker relationship than original table | $\underset{x \leftarrow / \rightarrow Y}{\sim}$ | Entering Z into equation reduces or eliminates $X$ 's influence on $Y$ |
| Interpretation (mediation) | All control tables show weaker relationship than original table | $X \rightarrow Z \rightarrow Y$ | Entering $Z$ into equation reduces or eliminates $X$ 's influence on $Y$ |
| Specification (moderation) | Only one (or some) of control tables show relationship from original table | $\begin{aligned} & \text { If } Z=1 \\ & X \leftarrow \rightarrow Y \\ & \text { If } Z \neq 1 \\ & X \leftarrow / \rightarrow Y \\ & \text { Or, preferably } \\ & X \\ & Z>X Z \rightarrow Y \end{aligned}$ | An interaction term of the form $X * Z$ predicts $Y$ |
| Suppression | Control tables reveal a relationship that was not evident in original table without controls | Without control for Z: $X \leftarrow / \rightarrow Y$ <br> With control for Z $x \leftarrow \rightarrow Y$ | Entering Z into equation allows $X$ to predict $Y$ |
| Distortion | Control tables show complex pattern of results |  | Entering Z into equation produces a complex pattern |

```
regression variables = DepVar IndVar1 IndVar2 IndVar3
    /statistics coeff r tol
    /descriptive = n
    /dependent = DepVar
    /method = Enter IndVar1
    /method = Enter IndVar1 IndVar2
    / method = Enter IndVar1 IndVar2 IndVar3.
```

regression variables=RawMJ3 democrat5 female
/statistics anova coeff $r$ tol
/descriptives = n
/dependent = RawMJ3
/method = enter democrat5
/method = enter democrat5 female.

| Model |  | Unstandardized Coefficients |  | Standard Coefficients Beta | Sig. | Tol |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | B | Std. Error |  |  |  |
| 1 | (Constant) | 1.108 | . 072 |  | . 000 |  |
|  | Democrat5 | . 734 | . 111 | . 209 | . 000 | 1.000 |
| 2 | (Constant) | 1.277 | . 076 |  | . 000 |  |
|  | Democrat5 | . 808 | . 110 | . 230 | . 000 | . 987 |
|  | female | -. 429 | . 072 | -. 186 | . 000 | . 987 |

$2 \times .111=.222$
$.734+.222=.956$
The $b$ value didn't change by this much. Therefore, we have replication.
regression variables=RawMJ3 democrat5 interest
/statistics anova coeff $r$ tol
/descriptives = n
/dependent = RawMJ3
/method = enter democrat5
/method = enter democrat5 interest.

|  |  | B | Std. Error | Beta | sig | Tol |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | (Constant) | 1.108 | . 072 |  | . 000 |  |
|  | Democrat5 | . 738 | . 111 | . 210 | . 000 | 1.000 |
| 2 | (Constant) | . 735 | . 113 |  | . 000 |  |
|  | Democrat5 | . 758 | . 110 | . 215 | . 000 | . 998 |
|  | interest | . 545 | . 128 | . 133 | . 000 | . 998 |

regression variables=RawMJ3 democrat5 black hisp asian
/statistics anova coeff $r$ tol
/descriptives = n
/dependent = RawMJ3
/method = enter democrat5
/method = enter democrat5 black hisp asian.

|  |  |  |  |  |  |  |
| :--- | :--- | ---: | ---: | ---: | ---: | ---: |
|  |  | B | Std. Error | Beta | sig | Tol |
| 1 | (Constant) | 1.108 | .072 |  | .000 |  |
|  | Democrat5 | .734 | .111 | .209 | .000 | 1.000 |
| 2 | (Constant) | 1.184 | .073 |  | .000 |  |
|  | Democrat5 | .904 | .113 | .257 | .000 | .923 |
|  | Black | -.055 | .148 | -.012 | .709 | .927 |
|  | Hisp | -.651 | .091 | -.233 | .000 | .880 |
|  | Asian | -.196 | .108 | -.057 | .071 | .938 |

The important point for you to take away here is that the empirical results supporting explanation and interpretation are identical. In both instances the original relationship is substantially reduced or sometimes completely goes away in the control tables.

Democrat $\rightarrow$ Liberal $\rightarrow$ MJ3

Complete Explanation

Perhaps the most theoretically important results using statistical control come from with cases of interpretation. This is because they can help understand the mechanism by which $X \rightarrow Y$. As a result, statistical control using interpretation can be very important for understanding the political meaning of relationships.
